Firefly Festival

2-6 Players | 60 Minutes | Ages 12+

Dusk settles over the archipelago and the first lanterns are lit. Build bridges between the islands, raise pagodas toward the sky and call the most spectacular festivals the islands have ever seen. Whoever lights the night with the most dazzling celebration will earn glory - but the Sōrin are few, and the last lantern always comes sooner than you think.

Rulebook version 12

Approximately 15 minutes per player

Overview

In Firefly Festival, players compete to build bridges between islands, raise pagodas toward the sky, and call the most spectacular festivals. Workers spread across the archipelago, and whoever lights the night with the most dazzling celebration will earn the greatest glory.

Each turn you take one **Main Action** - building a bridge, raising a pagoda, moving your workers or holding a festival - and you may add one **Secondary Action**: completing a goal or playing a Lucky Fish. Every festival spends a Sōrin, and the Sōrin are the clock. When the last one is placed, the game ends at once and the player with the most points wins.

Components

Common Components

1 Game Board - double sided: one side for 2-3 players, the other for 4-6

15 Sōrin tokens - placed on top of pagodas to seal them

48 coins - 36 worth 1 and 12 worth 5

18 island tiles

12 public goal cards (88 mm × 63 mm) - 4 Pagoda, 4 Bridge and 4 Worker goals

47 private goal cards (68 mm × 45 mm)

30 unique player power cards (80 mm × 120 mm) - for the variant on page 11

Per Player

20 bridge tokens

12 stackable pagoda floors

12 meeples

3 fish tokens

1 score marker

2 player aid cards (80 mm × 120 mm)

> Coins are not meant to run out
>
> The coin supply is not a limit on play. If the bank ever runs out of coins, use anything to hand and carry on.

The Archipelago

Islands and water lanes in the middle, the score track around the edge, the Palace, Prosperity and Festival Bonus down the right, and the goals along the bottom

Setup

1. Place the board in the centre of the table, the correct side up for the player count.
2. Take a number of island tiles based on the player count:

Island Size	2-3 Players	4-6 Players
Start (Orange)	**1**	**2**
Small (Green)	**5**	**6**
Medium (Yellow)	**3**	**6**
Large (Red)	**3**	**4**
Total	**12**	**18**

3. **Shuffle all of these tiles together**, starter tiles included, and place them at random on the island spaces of the map. Wherever the starter tiles land are this game's starter islands.
4. Sort the public goals into their three types by the colour of the card's heading - **red** Pagoda, **green** Bridge and **blue** Worker goals - and shuffle each pile. Deal one card from each pile face up onto the public goal spaces. Shuffle the remaining 9 cards together and deal one more. Return the other 8 to the box.
5. Shuffle the private goal deck and place it face down on the marked spot on the board.
6. Deal each player 2 Private Goal cards. Players may look at their own goals but must keep them secret from others.
7. Determine the first player randomly. Play proceeds clockwise.
8. Each player places their 3 fish in front of them, and their score marker on the 0 space of the score track.
9. **Take your starting workers and coins.** The two board sides pay a later seat in different currencies - the 12-island side in workers, the 18-island side in coins. Never both. See the two tables opposite.
10. Count out Sōrin tokens for the player count and place them on the **Sōrin space** of the board. Return the remainder to the box.

Players	2	3	4	5	6
Sōrin	6	8	10	12	15

The Sōrin are the length of the game: one is spent by every festival held.

The 12-island side - 2 to 3 players

Every player takes **5 coins**. There is a single starter island, and workers are the compensation for going later: the starting player places **3 workers** on it and each player after them places **one more**.

Seat	1st	2nd	3rd
Starting workers	3	4	5
Starting coins	5	5	5

The 18-island side - 4 to 6 players

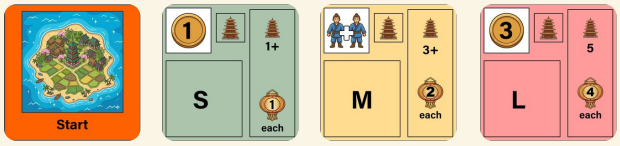

There are two starter islands and every player places **4 workers**, 2 on each. Here coins are the compensation: the starting player takes **5 coins** and each player after them takes **2 more**.

Seat	1st	2nd	3rd	4th	5th	6th
Starting workers	4	4	4	4	4	4
Starting coins	5	7	9	11	13	15

Unplaced workers wait in your supply - everyone owns 12 whatever their seat.

Reading an Island Tile

Every tile carries four numbers. Two tiles of each size exist - they score the same and differ only in the pagoda reward they pay.

Start Small Medium Large

Island	Start	Small	Medium	Large
Worker capacity	none	4	5	6
Pagoda height for a festival	never	1	3	5
Points per piece	never scores	1	2	4

Starter islands are the exception to almost everything: no worker limit, no pagodas, no festivals, and they never score.

Two optional variants

Shifting Waters and the **Unique Player Powers** are described on page 11. Leave both out of your first game.

Turn Structure

A turn is short. One thing you do on the islands, and one thing you do with your hand or your fish.

On your turn, take exactly **one Main Action**. You may also take **one Secondary Action**, either before or after it, but only one, and only once per turn. Then play passes clockwise.

The 4 Main Actions

- **Build a Bridge** - span two islands, 1 coin per segment (page 5)
- **Build a Pagoda** - add a floor, take the island's reward (page 6)
- **Move 3** - three movements of your workers (page 5)
- **Hold a Festival** - light the lanterns and score the island (pages 6-7)

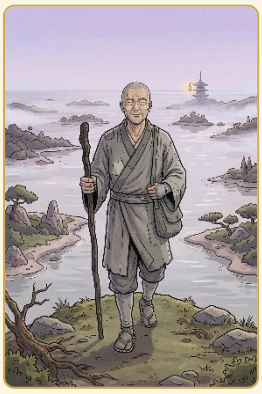

The 3 Secondary Actions

- **Claim a Public Goal** - pay one of your workers onto the card (page 8)
- **Complete a Private Goal** (page 8)
- **Use a Lucky Fish** - to the Palace for a main action, or to the Prosperity area for 3 coins (page 9)

One goal per turn

You have a single Secondary Action, so you may claim at most **one goal per turn** - public or private - and a turn spent on a Lucky Fish is a turn with no goal claimed.

Nothing else is limited. There is no hand of cards to manage, no round track, and no phase to remember. The game simply goes around the table until a Sōrin ends it.

Patience is a strategy. It is rarely the winning one

Worked Example - a turn from start to finish

It is **Mei's** turn. She has 6 coins, two fish still in front of her, and a private goal that asks for workers on four different islands.

Her Main Action is **Build a Bridge**. She spans a 3-segment gap between a Small island she already occupies and an empty Medium one, paying **3 coins**. One of those segments sits on a water reward showing 2 coins, so she takes those back immediately - the bridge has cost her a net **1 coin**. Because a new bridge grants free movement, she walks one worker across it onto the Medium island.

Her Secondary Action is now due. That fourth island was the last thing her private goal wanted, so she reveals it and scores its points.

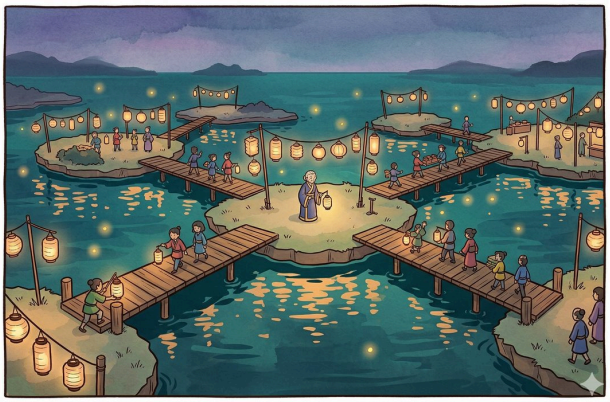

She could have spent a fish instead - but a fish is the same slot as the goal, and the goal was ready. Turn over; Kenji is next.

The shape of the game

Bridges do four jobs at once: they cost coins, they carry your workers for free, they count toward a festival's requirements and they score at every festival they touch - and at the end of the game they are the whole of your island score.

Pagodas are free but slow, and every floor you add makes the festival on that island bigger for **everybody** standing there, not only for you.

Festivals are where the points are. The first one held in the game pays its caller a **10 point** bonus and the ninth pays nothing at all, so waiting for the perfect celebration is rarely worth what it costs (see page 7).

Bridges are the spine of the archipelago

Build a Bridge

Main Action

Bridges connect islands, allowing workers to move between them, and count toward a festival's bridge requirement and its scoring.

Bridges must be built in a **straight line** between two islands, with no turns or crossings.

To build a bridge, you must have a **worker on either island**.

Pay **1 coin per segment** of bridge. You must complete the entire bridge in one action - it is not permitted to only build part of a bridge. If you cannot afford to pay for the bridge, or you do not have enough bridge pieces left in your supply, then you may not build a bridge.

Bridges can **never be moved**.

It is permitted for the same player to build multiple bridges between the same pair of islands.

Free Movement

After building a bridge, you may move any of your workers already on the two connected islands across the new bridge to the other island, in either direction.

Water Rewards

Dotted around the map are rewards on water tiles. If you build a bridge piece on a reward, you immediately gain the reward.

Icon	Water Reward
	Gain 2 coins
	Recruit a new worker - place it on either of the two islands the new bridge connects
	Draw a new Private Goal
	Gain 5 points
	Gain 7 points

Pay first, collect after!

You gain the reward **after** building the bridge. You cannot use rewards gained by building a bridge to pay for it!

Move 3

Main Action

Moving around the board is very strategic - it gets you in the right place for festivals and for building.

As your main action, you may make **3 movements** of your workers. This can be the same worker 3 times, or 3 workers 1 time each, or any combination in between.

To move, trace a path from the worker's current location to their destination island. Workers only move along bridges. A chain of connected bridges belonging to a **single player** counts as **1 move**. This means that a network of bridges owned by the same player can let you travel a long distance with a single move.

If the bridges belong to you, there is no charge to use them. If the bridge belongs to another player, you must **pay them 1 coin for each bridge** you use - that is per bridge, the length of the bridge is not relevant. If you cannot afford to pay for moving, then you cannot move.

So a single movement is one of exactly two things: a run of any length through **your own** network, or the crossing of **one** rival bridge. Weaving out of your network, across a rival bridge and back into your network is **three movements** - your whole action.

Island Capacity

Each island has a capacity based on its size - Small: 4 workers, Medium: 5, Large: 6. It is forbidden to exceed this limit at the end of your turn. You may move through islands that are at capacity, but you may not stop. The island capacity is shown on the island tile.

Starter islands have no worker limit - any number of workers may stand on one. Nothing else in the game may ever push an island above its capacity.

Small Medium Large

Worked Example - moving and paying tolls

Kenji's first movement runs along his own network of three linked bridges, crossing four islands - because they are all his, that whole journey is **1 move** and costs nothing.

His second movement crosses one of Mei's bridges, so he pays **Mei 1 coin**, however long that bridge is. His third crosses another of hers for **1 more coin** - three movements spent, 2 coins paid.

Build a Pagoda

Main Action

Pagodas give you an immediate reward and are very important for festivals.

Pagodas are built on the designated spot on islands. Pagodas can **never** be built on the starting islands.

To build a pagoda, you must have a **worker on the island**.

Place your pagoda floor onto the island, or on top of any pagoda floors already on the island. Multiple players may contribute floors to the same pagoda - a pagoda can have pieces from many different players.

Pagodas have a **maximum height of 5** - you may never place a sixth piece on a pagoda.

Building a pagoda is **free**. Each island has a pagoda reward shown on the island. As soon as you build the pagoda floor, immediately claim the reward shown on that island:

Icon	Pagoda Reward	Island
1	Gain 1 coin	Small
2	Gain 2 coins	Small
	Recruit 2 new workers - see below	Medium
	Draw a new Private Goal	Medium
3	Gain 3 coins	Large
4	Gain 4 coins	Large

Where your new workers land

Recruited workers join the island you have just built on, **while it has room** under that island's capacity - counting **every** player's workers, not just yours. Any worker that will not fit goes to a **starter island of your choice** instead, worker by worker.

So on a Medium island already holding 4 workers, one recruit joins it and the other goes to a starter island. If it already holds 5, both do.

When a Festival is held, a Sōrin marker is placed on top of that island's pagoda, sealing it permanently - no further floors may ever be added to it.

Hold a Festival

Main Action

Festivals are how you score most of your points in the game. Keep an eye on the islands as the pagodas grow and the bridges multiply.

For a festival to be called, **all three** of these requirements must be met:

- **Minimum pagoda height.** Each island has a minimum number of pagoda floors that must be placed before a festival can be called. This is displayed on the island: Small 1, Medium 3, Large 5.
- **Enough bridges.** The number of bridges connecting to the island must equal or exceed the height of the pagoda.
- **A worker present.** You must have a worker on the island - someone has to run the show!

You do **not** need to be the strongest player on the island. Being outnumbered there does not stop you calling its festival - one worker of yours is enough. Remember though that everybody scores their own pieces, so calling a festival from behind hands your rival more points than it hands you.

Count bridges, not neighbours

A 4-segment bridge counts once, exactly as a 1-segment bridge does, and **every owner's** bridges count toward the requirement - not just yours.

Because more than one bridge may connect the same pair of islands, doubling up a crossing you already have is a perfectly good way to serve a taller pagoda.

Festivals can never be held on a **starter island**, and an island that has already hosted one is sealed with a Sōrin and can never host another. If all the requirements are met, we hold a festival! Scoring one is described on the next page.

The lanterns are lit and the whole archipelago comes to watch

Scoring a Festival

1. Seal the island. Take a Sōrin from the supply and place it on top of the island's pagoda. That island can never host another festival and can never receive another pagoda floor.

2. Island scoring - everybody. Every player scores the island's point value for every worker, pagoda floor and bridge they have there. Bridges count per bridge; the length of the bridge is not relevant. Each island prints its value: **Small 1, Medium 2, Large 4**.

3. The Firefly Bonus - the caller only

For every worker standing on the island, the player who called the festival gains **1 point** - any player's workers, including their own. In addition, look at every other island directly connected to the festival island by a bridge: the caller gains **1 point** for every worker standing on those islands as well.

Workers near the festival island but not directly connected to it score nothing - they couldn't enjoy the fireworks without standing on a bridge.

4. The Sōrin Bonus - the caller only

The caller also gains the **Sōrin Bonus**. It depends on nothing but **how many festivals the table has already held** - count the Sōrin already sealing islands to see which festival yours is.

Festival of the game	1st	2nd	3rd	4th	5th	6th	7th	8th	9th+
Sōrin Bonus	**10**	**8**	**6**	**5**	**4**	**3**	**2**	**1**	**0**

The ladder is a **single shared track for the whole table**, it never resets and it never runs backwards. It is the same at every player count.

Finally, the fish come home. Any player with a worker on the island takes back **all** of their Lucky Fish, from the Palace and the Prosperity area alike - even players who did not call the festival. See **Use a Lucky Fish**.

A late festival is still a festival

A festival worth 0 Sōrin Bonus is worth calling. It still seals its island, still pays island points to everyone and the Firefly Bonus to you, still returns fish, and still spends a Sōrin off the game's clock.

Worked Example - a Medium island festival

Mei calls a festival on a Medium island with a point value of **2**. Its pagoda is 3 floors tall, 3 bridges reach the island and Mei has a worker there - every requirement is met. Two Sōrin already sit on other islands, so this is the **third festival** of the game.

1. Seal: Mei places a Sōrin on the pagoda.

2. Island scoring: Mei owns 2 workers, 2 pagoda floors and 1 bridge there: 5 pieces × 2 = **10 points**. Kenji owns 1 worker, 1 pagoda floor and 2 bridges: 4 pieces × 2 = **8 points**.

3. Firefly Bonus: 3 workers stand on the island (Mei's 2 and Kenji's 1) and 2 more stand on islands directly connected by bridge: 5 workers × 1 = **5 points** for Mei.

4. Sōrin Bonus: the third festival of the game pays **6 points** to Mei.

Mei scores 10 + 5 + 6 = **21 points**; Kenji scores **8**. Both had workers at the festival, so both take back all their Lucky Fish, and that island is finished for the rest of the game.

Half of it is being the caller

Of Mei's 21 points, 11 came from being the one who called it. That is the whole reason to commit - everything else on the island is shared out to whoever owns the pieces, including your rivals.

And the Sōrin Bonus only ever shrinks. The first festival of the game is worth 10 more than the ninth to whoever dares call it, so a smaller celebration held now often beats a grander one held four turns later.

The player aid repeats the requirements and this sequence

Claim a Public Goal

Secondary

Four public goals, and the whole table can see who is closest. Be first and score the most - but every claim costs you a worker for the rest of the game.

Four public goals are in play, face up on the board. Each one describes something to build or achieve on the islands.

If you meet a goal's condition, you may claim it. Take **one worker from your supply** and place it on the **highest free space** of the card, then score that space at once: **12** for the first player to claim it, **8** for the second, **4** for the third. With 2 players, the 4 space is not used.

- You may claim each goal **only once**.
- If your supply is empty, take one of your workers **from any island** instead. Check the condition before you remove it.
- The worker stays on the card until the end of the game. It is **not on the board**, so it counts for nothing else.

One goal per turn

You may claim only **1 goal per turn**, public or private.

Complete a Private Goal

Secondary

Private Goals are a way of scoring a lot of uncontested points. Try to score Private Goals on turns where you might not be able to claim a public goal.

Each player is given 2 private goals at the start of the game. On your turn, if you have met the requirements of the card, you may complete it and gain the points shown on the card. The card's points are the whole reward - there is no bonus on top.

You do **not** draw a replacement card. The only way of getting new Private Goals is through the rewards gained by building bridges and placing pagodas.

Remember, you may only claim **1 goal per turn** - see **One goal per turn** opposite.

Claim now, or wait?

You never have to claim a goal the moment you meet it. Waiting keeps your worker working on the board - but a rival who gets there first takes the 12. **Pagoda and Bridge goals** can never be undone, so they are safe to hold until a rival comes close. **Worker goals** can be: if your workers move away before you claim, you no longer qualify.

Summary of Goals

The 12 public goals - each game uses one Pagoda, one Bridge and one Worker goal, plus one more at random

Use a Lucky Fish

Secondary Action

Fish are considered lucky, and playing one at the right time can change the game dramatically.

Each player starts with **3 fish** in front of them. As your Secondary Action you may place one of them on the board, in one of **two** places:

Icon	Place your fish	You pay	You get
	The Palace	3 / 4 / 5 coins	one main action
	The Prosperity area	nothing	**3 coins**

If you have no fish left in front of you, you may not take this action at all.

The Palace

Place your fish on the next free slot of your Palace track and immediately pay the price shown: **3 coins** for your first fish there, then **4**, then **5**. If you cannot pay, you may not place the fish. The slots are not blocking - many players can be on the same slot.

You then immediately perform **one main action**: Build a Bridge, Build a Pagoda, Move 3 or Hold a Festival. A fish buys one main action, not a whole extra turn.

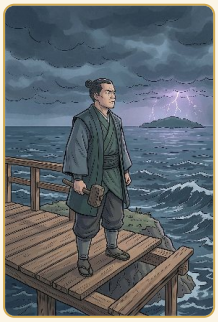

The Prosperity area

Place your fish on the Prosperity area beside the Palace. It costs **nothing**, and you take **3 coins** from the bank. That is the whole of it.

There is no price track here, and no limit on how many players may use it.

Two areas, two separate price tracks

Only fish placed in **the Palace** climb the 3 / 4 / 5 ladder. A fish sent to Prosperity never makes your next Palace fish dearer, and never counts as a fish in the Palace for a goal that asks for one.

The purse is tight and the night is long

The fish is your Secondary Action

Either destination uses up your Secondary Action, so you may not also complete a goal that turn. Your **Main Action is untouched** - a player who takes Prosperity still builds, moves or holds a festival on the same turn.

Getting your fish back

Whenever a festival is held on an island where you have a worker - **no matter who calls it** - you take **all** of your fish back into your supply, from the Palace and the Prosperity area alike. Your Palace price track resets with them, so the next fish you send there costs 3 again.

Standing where a rival is about to celebrate has its compensations.

Worked Example - digging yourself out

Kenji has **2 coins**. The bridge he wants is 4 segments, his workers are stranded behind one of Mei's bridges whose toll he cannot pay, and no pagoda is tall enough to celebrate. The Palace is no help either - he cannot afford its 3 coins.

So he sends a fish to **Prosperity** for **3 coins**, taking him to 5. That was his Secondary Action, so no goal this turn - but his Main Action is still his, and **Move 3** now buys him two crossings of Mei's network at 1 coin each.

He ends the turn with 3 coins, his workers where he wants them, and two fish left.

A fish is a decision, not an income

Three fish is all you have until a festival hands them back, and the festival has to be held where you are standing. Every fish is a choice between an action you cannot otherwise take, the coins to take it later, and the goal card you give up either way.

Fortune favours whoever is standing in the right place

End of the Game

Be watchful as the pagodas rise and the Festivals are held. The game could end sooner than you realise.

The game ends **immediately** when **either** of the following happens:

- The **last Sōrin** is placed by a festival - score that festival as normal.
- A player places their **last pagoda floor** - take that island's reward as normal.

Finish the action that ended the game, then go straight to Final Scoring. Nobody takes another action - not even the player whose turn it is.

There is no final round

The game stops in the middle of a round, so some players will have had one more turn than others. That is expected - the extra workers and coins handed out at setup are there to even out turn order.

Final Scoring

Add up everything scored during play, then each player scores their island network - and nothing else. Count the **largest group of islands joined together by your own bridges**. There is no route to trace - a group is simply every island your bridges hang together, however the network branches. If your bridges form separate groups, only the largest counts. A group below the bottom rung scores nothing, and a group between two rungs scores at the lower one.

12-island side	4	6	8	9	10	12
18-island side	6	8	10	11	12	14
Points scored	5	10	15	20	30	40

Nobody is compared to anybody

Your island score depends only on your own bridges. You can work it out without looking at another player's board, and no ladder rung is taken away from you because a rival built a bigger network.

Worked Example - final scoring on the 12-island side

Mei has built 9 bridges, and they hang together into a single group of **8 islands**. Eight is exactly the third rung, so she scores **15 points**.

Kenji has built just as many bridges, but in two clusters that never met: one joins **5 islands**, the other joins **4**. Only his largest counts. Five is past the 4 rung but short of the 6 rung, so he scores at the lower one: **5 points**.

Ten points of difference for the same number of bridges - joining your network up is worth more than spreading it out.

Victory!

The player with the most points wins. If there's a tie, the player with the most coins wins. If there's still a tie, players rejoice in their shared victory.

One last night of lanterns before the tally

Unique Player Powers

Unique player powers give the game a new twist and challenge you to play the game in different ways.

Once you are familiar with the game, you may like to play with unique player powers. Shuffle the deck of powers at the start of the game and deal each player 2 cards. Each player secretly selects one card and discards the other. Players then reveal their cards and read out their powers for the other players.

Most cards grant an ongoing power, but some instead change what you begin the game with. A card that changes your starting workers or coins is applied **after** the setup on page 3, so your seat's workers and coins are worked out first and the card adjusts them.

> *Thirty ways to celebrate*
>
> The powers reward very different plans - some want a sprawling bridge network, others a single towering pagoda or a full purse. Listen carefully as they are read out, because your rivals' powers hint at where they are heading.

Variant - Shifting Waters

The tide moves the fortunes of the archipelago around.

For a different map every game, ignore the water rewards printed on the board. During setup, shuffle the water reward tokens face down and deal them onto the marked water spaces instead. Everything else plays exactly as normal.

The two variants combine happily, and either may be used on its own.

Hints for Your First Game

Nothing here is a rule. It is what the islands teach you in the first hour.

- **Bridges do four jobs.** They carry your workers for free, they satisfy a festival's bridge requirement, they score at every festival they touch, and at the end of the game they are your entire island score. A coin spent on a bridge is rarely wasted.
- **Join your network up.** Two small clusters score as the larger one alone. One bridge that links them can be worth twenty points.
- **Call a festival early.** The first one held in the game pays its caller 10 bonus points and the ninth pays none. A modest celebration now usually beats a magnificent one later.
- **You do not need to be the biggest.** One worker is enough to call a festival - but check what everybody else is holding on that island first, because they all score too.
- **Stand where a rival is about to celebrate.** You score your own pieces, and you get every one of your fish back.
- **Watch the Sōrin.** They are the game's clock. When only two are left, plan for the ending rather than the engine.
- **Money is tightest at the start.** The Prosperity area is for the turn when nothing is affordable - but it costs a Lucky Fish and your secondary action, so it is a rescue, not a plan.
- **Watch the public goals, not just your own.** All four are face up. A Pagoda or Bridge goal you have met is safe to hold until a rival is one move away. A Worker goal can slip away if your workers move, so take it while you have it.

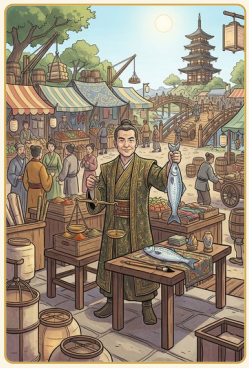

A Few of the Powers - deal two, keep one, reveal it to the table

The Oracle

Quick Reference

Your Turn

One **Main Action**, plus optionally one **Secondary Action** before or after it.

Main Actions - choose one

- **Build a Bridge** - worker on either island; straight line; 1 coin per segment; water rewards collected after building; free movement across it.
- **Build a Pagoda** - worker on the island; free; maximum height 5; never on a starter island; claim the island's reward at once.
- **Move 3** - your own connected network is 1 free move; each rival bridge is its own move at 1 coin to its owner; capacity 4 / 5 / 6 at end of turn.
- **Hold a Festival** - pagoda height 1 / 3 / 5; bridges at least equal to pagoda height; your worker present. No majority needed.

Secondary Actions - choose one

- **Claim a Public Goal** - meet its condition, pay a worker onto its highest free space: 12 / 8 / 4 (12 / 8 with 2 players). Once per goal.
- **Complete a Private Goal** - no replacement drawn, no bonus.
- **Use a Lucky Fish** - to **the Palace** for 3 / 4 / 5 coins, then one main action; or to **the Prosperity area**, free, for 3 coins. Separate price tracks.

Only **one goal per turn**, and a Lucky Fish uses that slot instead.

Setup - each side pays a later seat in one currency only

Side	Players	Workers	Coins	Sōrin
12-island	2-3	**3 / 4 / 5**	5 each	6 / 8
18-island	4-6	4 each	**5 / 7 / 9 / 11 / 13 / 15**	10 / 12 / 15

Festival Scoring

- Seal the pagoda with a Sōrin - that island is finished.
- **Everyone** scores the island's value for each worker, pagoda floor and bridge they own there - **Small 1, Medium 2, Large 4**.
- **Firefly Bonus, caller only** - 1 point per worker on the island and on every island directly connected by a bridge.
- **Sōrin Bonus, caller only** - by how many festivals the table has held:

Festival	1st	2nd	3rd	4th	5th	6th	7th	8th	9th+
Bonus	10	8	6	5	4	3	2	1	0

- Everyone with a worker present takes back **all** their Lucky Fish.

Game End

- Triggered by the last Sōrin being placed, or a player's last pagoda floor.
- The game ends **immediately**: finish that action, then go to final scoring. No final round.

Final Scoring

- Score your **largest group** of islands joined by your own bridges. Below the bottom rung scores nothing; between rungs scores at the lower rung.

12-island side	4	6	8	9	10	12
18-island side	6	8	10	11	12	14
Points	5	10	15	20	30	40

- Most points wins; ties are broken by the most coins.
